1 Installation Guide

TINDA POS is an offline, desktop point-of-sale application built for Philippine sari-sari stores. It works without an internet connection, keeps all your data on your own computer, and supports cash, GCash, Maya, and utang (credit) sales.

System Requirements

- **Windows:** Windows 10 or 11 (64-bit), 4 GB RAM, about 200 MB free disk space.
- **Linux:** any modern 64-bit distribution (Ubuntu, Arch, Fedora, etc.), 4 GB RAM.
- **Display:** 1366×768 or higher recommended.
- **Offline:** no internet connection is ever required to run the app.

Installing on Windows

The Windows build is distributed as a single setup file: **TindaPOS-Setup-1.0.0.exe**.

1. Double-click **TindaPOS-Setup-1.0.0.exe** to start the installer.
2. If Windows SmartScreen warns you, click **More info** then **Run anyway**. The app is not code-signed yet, so this notice is expected.
3. Choose the **Installation directory** (the default location is fine).
4. Tick the options to create a **Desktop shortcut** and a **Start Menu** shortcut.
5. Click **Install** and wait for it to finish. The app will then offer to **Run TINDA POS**.

Your data is saved in `%APPDATA%\TINDA POS` (database, backups, receipts). Uninstalling the app **does not delete your data**, so you never lose your sales history.

Installing on Linux (AppImage)

1. Right-click **TindaPOS-1.0.0.AppImage** and choose **Properties** → **Permissions**, then check **Allow executing file as program**.
2. Alternative: open a terminal and run `chmod +x TindaPOS-1.0.0.AppImage`.
3. Double-click the AppImage to launch TINDA POS.
4. If FUSE is not installed, install it (e.g. `sudo apt install libfuse2` on Debian/Ubuntu), or run the app with `--appimage-extract-and-run`.

Linux data is stored under `~/.config/tinda-pos` (or a folder you set).

2 Getting Started

First Run — Set Up Your Store (wizard)

The first time you open TINDA POS, a 3-step setup wizard appears. Fill it in once and you're done for good.

Step 1 · Store Details

- **Store Name *** — the name shown on your receipts (required).
- **Owner Name, Address, Phone** — printed on your receipts.

Step 2 · Admin Account

- **Manager Full Name** — the owner/manager name.
- **Username *** — the login username (default: admin).
- **Password *** — at least 4 characters.
- **Quick PIN *** — a 4-digit PIN for fast daily logins.
- **Important:** keep these somewhere safe. You need them to log in every day.

Step 3 · Receipt & Data

- **Receipt Header** — an extra line on top of your receipt (e.g. store address).
- **Receipt Footer** — a closing line (e.g. "Salamat po!").
- **Load sample data** — ticks in ~18 common sari-sari items so you can try the POS immediately.

Click **Finish Setup** when done. You will be logged in automatically with your new admin account.

Logging In

Every time you open the app you will be asked to log in. There are two ways:

- **Password** tab — enter your Username and Password.
- **Quick PIN** tab — type your 4-digit PIN for a fast login.

A **shift (time-in)** is opened automatically the first time you ring up a sale, so cashiering starts right away.

Using the Sidebar

The dark sidebar on the left is your main navigation. It lists every section of the app: Dashboard, POS, Inventory, Customers, Utang, Expenses, Suppliers, Transactions, Reports, Backup, and Settings.

3 Point of Sale (POS)

The POS page is where you ring up sales. It is the heart of the app and is designed for speed.

Ring up a sale

1. **Find the product** — use the search box with the product name, SKU, or barcode, or browse the product grid.
2. **Add to cart** — click a product to add one unit. Adjust quantity with the +/- buttons in the cart.
3. **Checkout** — click **Checkout**; the total is shown automatically.

4. **Choose payment** in the checkout window:

- **Cash** — type the amount received; the change (**sukli**) is computed and shown automatically.
- **GCash / Maya** — enter the **reference number** for tracking.
- **Utang (credit)** — pick a customer so the amount is added to their balance.

5. Confirm the sale. The receipt is generated and your inventory and balances are updated automatically.

Stock and money are tracked for every single sale, so your inventory, utang balances, and daily sales reports stay accurate with no extra work.

4 Inventory & Products

The Inventory page manages your products, categories, prices, and stock. Products can have **tingi** (per-piece) units — for example one sachet of shampoo, one stick of cigarette, or one can of sardines.

Adding a product

1. Click **Add Product**.
2. Fill in the details: **Name**, **Category**, **Supplier**, **SKU/Barcode**, **Sell Price**, and **Cost**.
3. Set the **unit** (sachet, can, piece, bottle, etc.) and initial **stock quantity**.
4. Optionally set a **Low-stock alert level** so you get warned before you run out.
5. Click **Save**.

Products are shown with colored badges — green when healthy, amber when low, red when out of stock — so you always know what to reorder.

5 Customers & Utang (Credit)

Customers

The Customers page stores your regular (suki) customers. Add a customer before selling to them on utang.

- Click **Add Customer** and enter **Full Name** and optional **Phone/Address**.
- Each customer can have a **credit limit** (optional) to control how much utang they can carry.

Utang (Credit Ledger)

The Utang page shows every customer's outstanding balance and full credit history.

Recording a payment

1. Find the customer with the outstanding balance.
2. Click **Pay** (or **Adjust** to fix an error).
3. Enter the amount paid. The balance is reduced and the payment is logged to their ledger.

Customers who go over their **credit limit** are flagged, and full history is kept for every sale-on-credit and payment.

6 Expenses

Record your store expenses here (rent, electricity, water, load, etc.). You can group them by category. Expenses are combined with sales on your Reports so you can see true profit.

1. Click **Add Expense**.
2. Choose a **category**, enter the **amount**, date, and optional note.
3. Save. The expense is added to your reports.

7 Suppliers & Purchases

Keep your list of suppliers (where you buy stock). Each supplier shows their past **purchases** and the **products** they supply, so reordering is fast.

- Add a supplier with **Name**, **Contact**, and **Address**.
- Click a supplier to see everything you buy from them and the items they provide.

8 Transactions, Refunds & Voids

The Transactions page lists every sale. You can view a full receipt, refund items, or void a mistaken sale.

Refunding a sale (returns)

1. Open the sale in Transactions.
2. Click **Refund** and pick which items the customer returned.
3. The items are **returned to stock** and refunds are tracked on your reports.

Voiding a sale

1. Open the sale and click **Void**.
2. Confirm the void. The sale is cancelled, **stock is restored**, and any utang entry is removed.

Refunds and voids both put products back on your shelf and correct your totals, so your day-end numbers always reconcile.

9 Dashboard & Reports

Dashboard

The first screen after logging in. It shows today's big picture at a glance:

- **Sales**, **Profit**, **Utang (receivables)**, and **Expenses** totals.
- **Low/out-of-stock** products that need reordering.
- **Recent transactions** and any **overdue/near-limit** customers.

Reports

The Reports page gives you money and stock insight across sales, inventory, and utang.

- **Sales** — total sales, profit, items, transactions, discounts, refunds, and expenses; grouped daily, weekly, or monthly.
- **Inventory** — stock levels and low-stock items.
- **Utang** — customer balances and outstanding receivables.
- **CSV Export** — download any report as a CSV file you can open in Excel.

10 Backup & Restore

Your data is the most valuable thing in the app — back it up regularly.

Creating a backup

1. Open the **Backup** page.
2. Click **Create Backup**. A timestamped backup file is saved to your backup folder.
3. Copy that file somewhere safe (USB drive, cloud drive, another computer).

Restoring a backup

1. On the Backup page, choose a previous backup from the list.
2. Click **Restore** and confirm. Your data is restored to that point in time.

Back up at least once a week (or every day if the store is busy). Keep copies off the machine so you're safe even if the computer breaks.

11 Settings

The Settings page has three tabs:

- **Store** — edit store name, owner, address, phone, TIN, currency, and low-stock default level.
- **Receipt** — customize the receipt header and footer, and receipt format.
- **Users** — add cashiers/staff, set their role, and reset a password or PIN.

12 Data, Storage & Safety

Where is my data? (Offline-first)

TINDA POS stores everything in a local SQLite database on your computer. **No cloud, no internet, no data leaving your store.**

- **Windows:** %APPDATA%\TINDA POS
- **Linux:** ~/.config/tinda-pos

- Subfolders: database, backups, receipts, exports, logs.

Troubleshooting

- **Forgot the admin password?** — Restore a backup made before you changed it, or contact support.
- **App will not open on Windows?** — Right-click the setup and choose **Run as administrator**, or check that your antivirus is not blocking it.
- **SmartScreen warning** — expected since the installer is unsigned; click **More info** → **Run anyway**.
- **Linux AppImage won't launch** — install `libfuse2`, or run `--appimage-extract-and-run`.

Support

For questions and feedback, or to report a problem, reach out via the PHCorner thread where you downloaded TINDA POS.
